#B. Consider the task of classifying a customer who owns a bank credit card and is actively using online banking services. Looking at the pivot table, what is the probability that this customer will accept the loan offer? [This is the probability of loan acceptance (Loan = 1) conditional on having a bank credit card (CC = 1) and being an active user of online banking services (Online = 1)].

```
Ub.Loan.CC1 <- 77/3000 #According to the pivot table, the value for Loan is 77, and the value for CC is
Ub.Loan.CC1 # which is 26 %.
## [1] 0.02566667
#C. Create two separate pivot tables for the training data. One will have Loan (rows) as a function of
Online (columns) and the other will have Loan (rows) as a function of CC.
melt1 = melt(train,id=c("Personal.Loan"), variable = "Online") # Melting Personal loan and Online data i
## Warning: attributes are not identical across measure variables; they will be
## dropped
melt2 = melt(train,id=c("CreditCard"),variable = "Online") # CREDIT CARD DATA MELTING WITH REFERENCE TO
## Warning: attributes are not identical across measure variables; they will be
## dropped
cast1 =dcast(melt1,Personal.Loan~Online) # Casting Personal loan and online values
## Aggregation function missing: defaulting to length
cast2=dcast(melt2,CreditCard~Online) # Casting Personal loan and online values
## Aggregation function missing: defaulting to length
Ub.Loanonline=cast1[,c(1,13)]
Ub.LoanCC = cast2[,c(1,14)]
Ub.Loanonline #shows the number of personal loans in reference to online
##

6. P(Loan=0)

Ub.Loan0= 2725/(2725+275) # We can obtain the Loan = 0 values by the pivot table above.
Ub.Loan0

## [1] 0.9083333

E. Use the quantities computed above to compute the naive Bal probability P(Loan = 1 | CC = 1, Online = 1).

ub.Naivebayes = ((77/(77+198))*(166/(166+109))*(275/(275+2725)))/(((77/(77+198))*(166/(166+109))*(275/(ub.Naivebayes # -91 % is the probability

## [1] 0.09055758

F. Compare this value with the one obtained from the pivot table in (b). Which is a more accurate estimate?
9.05% are very similar to the 9.7% the difference between the exact method and the naive-base method is
```

F. Compare this value with the one obtained from the pivot table in (b). Which is a more accurate estimate? 9.05% are very similar to the 9.7% the difference between the exact method and the naive-base method is the exact method would need the the exact same independent variable classifications to predict, where the naive bayes method does not.

```
library(caret)
library(e1071)
ub.nb.train = ub.train[,c(10,13,14)] # Personal loan, credit card, and online column training dataub.nb
ub.naivebayes.1 = naiveBayes(Personal.Loan~.,data=ub.nb.train) #Using the naivebayes algorithm to perso
ub.naivebayes.1
